

## Prince George Therapy

Prince George Therapy - A conventional therapy for chronic soreness is named prolotherapy or nonsurgical ligament reconstruction. It is beneficial in treating conditions like neck and back soreness, fibromyalgia, chronic tendonitis, sports wounds, unresolved whiplash injuries, sciatica, degenerated or herniated discs, arthritis, TMJ, partly torn ligaments, tendons and cartilage.

What is prolotherapy? It is first necessary to acknowledge what the word prolotherapy itself signifies. ``Prolo`` is short for proliferation. The treatment causes the growth, formation or proliferation of new tissue in parts where it has become frail and typically where the pain is present.

Ligaments essentially are the structural "rubber bands" that hold bones to bones inside our joints. Ligaments could become injured or weak and may not heal back to their original endurance or potency. This occurs largely as the blood supply to ligaments is restricted, and therefore healing is gradual and never always complete. Ligaments also have multiple nerve endings and this allows the individual to feel throbbing on the areas where the ligaments are weak or damaged.

Tissues that connects muscles to bones are referred to as tendons. Also, in the exact same manner tendons usually become wounded and bring about pain.

The usage of prolotherapy entails injecting sugar water mixture or dextrose into the ligament or tendon anywhere it links to the bone. A localized tenderness normally happens when this mixture is injected to the frail parts. The blood flow increases as a result and the circulation of vitamins stimulates the tissue to repair itself.

As history points out, Hippocrates was the very first to utilize this version of therapy on soldiers who had dislocated or torn shoulder joints. He would inject a hot poker into the joint and it'll heal normally. The principle is similar today, initiating the body to restore itself.

How long is it going to take to finish a course of treatments?

Response time for treatment varies from individual to individual owing to our own individual healing ability. The normal number of treatments is 4 to 6 for an area treated, although some may have 10 or more and a few might solely take a number of treatments before they feel better. The best thing to try and do would be to have a consultation by a trained physician ahead of time to make sure you are a suitable candidate. After therapy starts, the doctor can relate how well you're responding and might provide an accurate estimate.
